What is &

Why

Typescript

What is Typescript?

TypeScript is a syntactic superset of JavaScript which adds static typing.

Typescript is a Syntactic Superset

Javascript

Typescript

### Why Typescript?

As project size increases, it becomes hard to maintain the Javascript code as it is loosely typed language.

TypeScript allows specifying the types of data being passed around within the code, and has the ability to report errors when the types don't match.
